FRONT MATTER

Copyright and course information

Course: The Complete Digital Marketing Course. Chapter 3: Make a Website (WordPress). Written by Varun for SkillNavora.

Item	Details
Document	Skillnavora — Chapter 3: Make a Website (WordPress)
Author	Varun, for SkillNavora
Brand	© SKILLNAVORA — THE COMPLETE DIGITAL MARKETING COURSE
Status	Draft for learners. Verification status is shown in the source table below.

Fact-check status

The live official sites could not be opened from the workspace used to write this guide. So every price, plan limit, dashboard menu, plugin feature and statistic is marked **not verified**. Use the official link beside each one, and confirm it before you act. Where a link could not be confirmed, the guide gives a general official help page instead.

REPLACE BEFORE YOU TRUST

Before publishing, a reviewer should open each official page below and record the date checked: Bluehost help and pricing, Astra and Elementor documentation, WordPress documentation, Gmail Help, Google Workspace Admin Help and ICANN.

FRONT MATTER

How to use this workbook

Read one lecture, do its steps, then tick the checklist. Print this guide or fill it in on screen.

1. Work in order: 3.1 to 3.8. Each lecture builds on the last.
2. Keep the Glossary open in another tab.
3. Use the Troubleshooting table when a step fails.
4. Tick the completion checklist at the end of each lecture.
5. Fill in the worksheets in Section 16 as you go.

Time planning: the course demonstration aims at about 10 minutes for a quick build. A first-time beginner should plan roughly 1 to 2 hours, including waiting for hosting, SSL and email setup. The 10 minutes is a demonstration target, not a promise.

FOUR-PILLAR ICONS

Understand = learn the idea. **Implement** = do the steps. **Optimise** = make it secure and fast. **Apply** = do the task and check the result.

CHAPTER 3 OF 19

Make a Website (WordPress)

By the end of this chapter you will have a live, secure WordPress website with your own domain email. You do not need to write code. Take it one step at a time.

What you will build

- A WordPress.org website on your own domain name
- A free SSL certificate, so the address starts with https://
- Up to 5 business email addresses, read in one Gmail inbox
- A domain verification done on time, so the site stays online

How this chapter is organised: 4 pillars

Pillar	What you do
1. Understand	Learn the terms: hosting, domain, CMS, theme, plugin, SSL, DNS.
2. Implement	Follow the numbered steps. No coding.
3. Optimise	Make the site secure, fast, mobile-friendly and easy to read.
4. Apply	Do the assignment, fix the problems, and submit your final project.

Contents

1. Lecture 3.1: Why WordPress?
2. Lecture 3.2: WordPress.org or WordPress.com?
3. Lecture 3.3: Build the site in five steps
4. Lecture 3.4: Free business email
5. Lecture 3.5: Business email in Gmail
6. Lecture 3.6: Free SSL (https)
7. Lecture 3.7: Verify your domain (deadline)
8. Lecture 3.8: Assignment and final project
9. Tools and links
10. Troubleshooting
11. Glossary
12. Completion checklist

TIP

Use the links in this chapter to jump to any lecture. Each lecture ends with a short knowledge check.

Core learning objective

Learn to build and launch an SSL-secured, mobile-friendly WordPress.org website without writing code.

By the end you can:

- Explain WordPress.org and WordPress.com.
- Explain hosting, domain, DNS, SSL, CMS, theme and plugin.

- Register a domain and a hosting plan.
- Install WordPress and set it up.
- Build a site with Astra and Elementor.
- Create pages, a header, a footer and a menu.
- Create a business email and connect it to Gmail where the method is still supported.
- Turn on SSL and https.
- Verify your domain registrant email.
- Launch and test the site.

Time: the course demonstration target is 10 minutes. A realistic first build for a beginner is 1 to 2 hours.

START HERE · TOOLS

Tools and what each one does

These are the tools behind every step. Each one has a free or paid option. Check the official page for the current plan.

Component	Tool	What it does
Website software (CMS)	WordPress.org	Free software that runs your site
Hosting and domain	Bluehost WordPress hosting	Keeps your site online and gives you a domain name (course example)
Theme	Astra	The base design of your site
Starter templates	Astra Starter Templates	Ready-made page designs you can import
Page builder	Elementor	Drag-and-drop editor for pages
Business email inbox	Gmail	One inbox for all your email addresses
Analytics	Google Analytics	Measures visits (set up in Chapter 12)

Helpful references

- WordPress.com (the hosted service: read Lecture 3.2 before you choose)
- Gmail: send mail as (official guide)
- Bluehost: WordPress.com vs WordPress.org

PLEASE CHECK FIRST

Screens, menu names and plugin versions change. The links in this chapter were not checked live from this workspace. Confirm each one on its official site.

LECTURE 3.1 · UNDERSTAND

Why use WordPress instead of Wix, Weebly or Squarespace?

WordPress is a free, open-source website system. You can move it to another host, and many developers make themes and plugins for it.

Pillars: Understand · Apply

1. Demand for WordPress skills

WordPress is one of the most used website systems in the world. Many businesses and freelance clients ask for WordPress work. Market share numbers depend on how they are counted, so check any figure on the official source before you use it in marketing.

2. You are not locked in

WordPress software is free. You pay a host to keep the site online. If your host raises prices, you can move your site to another host. With closed website builders, your site stays on their platform.

3. Themes and plugins

- **Theme:** the design of your site.
- **Plugin:** an add-on for one job, such as SEO, contact forms, backups, security or online shops.
- Free and paid versions exist for both. Free versions are often enough to start.

Compare the platforms

Question	WordPress.org	Wix, Weebly, Squarespace
Who owns the site?	You do	The platform sets the rules
Can you move hosts?	Yes	Usually not
Themes and plugins	Very many, from many makers	Fewer, set by the platform
Cost	Software free; host and domain paid	Monthly plan fees

Practice exercise

Compare WordPress, Wix and Squarespace for four goals: a portfolio, an agency site, an online shop and a blog. For each one, write down ownership, flexibility, cost and upkeep.

WATCH OUT

Do not repeat a market share figure or a list of brands unless you have checked its date and source.

KNOWLEDGE CHECK

1. What does open-source mean? (Answer: the code is free to use and change, and no single company owns it.)
2. Why does hosting portability matter? (Answer: you can move the site if prices rise.)
3. What is a plugin? (Answer: an add-on that adds one feature.)

Common mistakes

- Quoting a market share figure with no date or source.
- Assuming a closed builder lets you move your site later.

Lecture completion checklist

Done	Item
☐	I can explain open source in one sentence.
☐	I can name two differences between WordPress and a closed builder.

LECTURE 3.2 · UNDERSTAND AND OPTIMISE

WordPress.org or WordPress.com?

Both names are WordPress, but they are different services. For a business or a client site, choose WordPress.org.

Pillars: Understand · Optimise

WordPress.org: self-hosted

- You install it on your own hosting.
- You control the site, the theme, the plugins and the ads.
- You can add tools such as Google Analytics.

WordPress.com: hosted service

- WordPress.com runs the site for you, on plans with different limits.
- Some features and some domain or plugin options need a paid plan.
- The company can remove a site that breaks its terms of service.

Comparison

Topic	WordPress.org	WordPress.com
Control	Full control	Limited by its terms and plan
Ads on your site	You decide	Plan rules apply
Analytics tools	You can install them	Check which plan allows them
Plugins and themes	Wide choice	Depends on the plan
Custom domain	Yes	Depends on the plan
Moving your site	Easy to move	Harder to move

Recommendation

For learning and for client work, use WordPress.org on your own hosting. Plans and feature limits on WordPress.com change, so check the current page before you decide.

WATCH OUT

Beginners often sign up for WordPress.com by mistake. Check the address you are on: WordPress.org is the self-hosted version used in this chapter.

KNOWLEDGE CHECK

1. Which version lets you install any plugin? (Answer: WordPress.org.)
2. Why is control important for a business? (Answer: the site stays yours and you can move it.)

Common mistakes

- Signing up for WordPress.com by mistake.

- Assuming every plan has the same plugin rules.

Lecture completion checklist

Done	Item
☐	I can name the self-hosted version.
☐	I know the plan limits of the hosted version are on its pricing page.

LECTURE 3.3 · IMPLEMENT

Build the site in five steps

This is the 10-minute demonstration in the course. A real beginner usually needs more time for the first build, so plan for about one to two hours, with breaks. The steps are the same.

Pillars: Implement · Optimise

Step 1: Get hosting and a domain

Go to Bluehost WordPress hosting and choose a plan. Pick a short, clear domain name. Skip the extra add-ons on the checkout page, and skip the onboarding questions if you want.

1. Click Get Started and choose the plan you want.
2. Type your domain name, or choose one later.
3. Fill in your account details and pay.
4. Untick the optional extras on the checkout page.
5. Create your password and save it in a password manager.

WATCH OUT

Save your login details safely. Check your inbox and spam folder for the welcome and order emails.

Step 2: Open WordPress

In your hosting dashboard, click WordPress. Click Visit Site to see your site. Then set clean web addresses (permalinks).

1. Go to Settings, then Permalinks.
2. Choose Post name.
3. Click Save Changes.

TIP

Post name gives short, readable web addresses. Readable addresses help visitors and search engines.

Step 3: Install Astra and a starter template

Use the WordPress dashboard. Menu names can change between versions, so look for the same names on your screen.

1. Go to Appearance, then Themes, then Add New.
2. Search for Astra, then click Install and Activate.
3. Go to Plugins, then Add New.
4. Search for Astra Starter Templates, then click Install Now and Activate.
5. Click See Library, choose Elementor, and filter for free designs.
6. Preview a design you like, then click Import Site.

Step 4: Customise the site

A. Edit a page

1. Open the page and click Edit with Elementor.
2. Click text or a button to change it.
3. Use the Style tab to change colours.
4. Right-click a section background to add an image or gradient.
5. Click Update.

B. Header and logo

1. Click Customize at the top.
2. Click the blue icon next to the logo and upload your logo.
3. Check the view on desktop and on phone.
4. Click Publish.

C. Footer

1. Click Edit with Elementor, then Site Footer.
2. Edit the copyright line, contact details and links.
3. Click Update.

D. New page

1. Click + New, then Page.
2. Enter a page title.
3. Click Edit with Elementor and drag in heading and text blocks.
4. Click Publish.

E. Menu

1. Click Customize, then the blue icon next to Menu, then Edit Menu.
2. Click + Add Items and choose your pages.
3. Drag items to reorder. Click Publish.

Step 5: Launch the site

A new site shows a Coming Soon page. In the dashboard, click Coming Soon, then Launch Your Site.

WATCH OUT

Only launch when the domain is verified (Lecture 3.7) and the SSL is on (Lecture 3.6).

KNOWLEDGE CHECK

1. Where do you change the permalinks? (Answer: Settings, then Permalinks.)
2. What is the difference between a theme and a template? (Answer: the theme is the base design; a template is a ready-made page layout.)

Common mistakes

- Pressing Launch before verifying the domain.

- Choosing a long or hyphenated domain name.

Lecture completion checklist

Done	Item
☐	Domain and hosting active.
☐	Astra installed and a starter template imported.
☐	Five pages and a menu done.
☐	Coming Soon turned off.

LECTURE 3.4 · IMPLEMENT

Set up free business email

Your hosting plan can include business email addresses. Use the free ones in the Advanced section. Do not pay for an upgrade you do not need.

Pillars: Implement · Apply

1. Make sure your domain is active.
2. In the left sidebar of your Bluehost dashboard, go to Advanced, then Email Accounts, then Create.
3. Choose a username such as support or hello, and a strong password. Click Create.
4. Repeat for each person or team email, up to the limit shown on your plan.
5. Go to the Bluehost webmail page, sign in, and open your mail.
6. Go to Settings, then Preferences, then Personal Information. Add your full name, for example Your Name, Your Brand.
7. Send a test email to yourself to check it works.

WATCH OUT

Some pages show an email upsell with a monthly fee. Choose Advanced, then Email Accounts, to use the included accounts.

KNOWLEDGE CHECK

1. Why set a display name? (Answer: people see a name, not just an address.)
2. How do you check email works? (Answer: send a test email and read it.)

Common mistakes

- Using a personal address for business mail.
- Forgetting to set the display name.

Lecture completion checklist

Done	Item
☐	Email address created.
☐	Test email sent and received.
☐	Display name set.

LECTURE 3.5 · IMPLEMENT AND APPLY

Add your business email to Gmail

You can read several email addresses in one Gmail inbox. There are two methods. Try Method 1 first. Use Method 2 if Method 1 gives errors.

Pillars: Implement · Optimise · Apply

Method 1: POP3 and SMTP (direct)

CHECK FIRST: THIS OPTION MAY BE GONE

Google has been removing support for fetching mail from outside accounts into Gmail. Before you start, open the current Gmail help and check whether *Accounts and Import, then Add a mail account* still appears for your account. If it does not, skip to Method 2. Verify on Gmail Help (support.google.com/mail).

1. In Gmail, click the gear icon, then Settings, then Accounts and Import.
2. Click Add a mail account and enter your business address.
3. Copy the POP3 server and port from your host's mail setup page.
4. Untick Leave a copy of retrieved message on the server (this saves hosting space).
5. Tick Always use a secure connection (SSL).
6. Tick Label incoming messages, and untick Archive incoming messages.
7. Choose Yes, I want to be able to send mail as, and enter the SMTP server details.
8. Enter the code sent to your business inbox to confirm.
9. Under Send mail as, choose Reply from the same address the message was sent to.

Method 2: Forwarding and a filter (fallback)

1. Sign in to the business email account and open Settings, then Forwarding.
2. Add your Gmail address as the forwarding address, and enter the confirmation code Gmail sends you.
3. Turn forwarding on and save.
4. In Gmail, go to Settings, then Accounts and Import, then Send mail as, and add the business address.
5. Send yourself a test message. Open it, click the three dots, and choose Filter messages like these.
6. Clear the From field completely. Type the business address in the To field.
7. Click Create filter, choose Apply the label, then New label, and pick a colour.

WATCH OUT

With the filter, the From field must be blank. If you keep the old address there, the filter will not work.

TIP

Give each business address its own label colour. You will see at a glance which inbox a message came to.

KNOWLEDGE CHECK

1. What should Reply from the same address be set to? (Answer: the setting that makes replies come from the address the message was sent to.)
2. What is the most common Method 2 mistake? (Answer: leaving the From address in the filter.)

Common mistakes

- Keeping the old address in the From field.
- Choosing Method 1 when it is no longer offered.

Lecture completion checklist

Done	Item
☐	Method chosen and checked against current Gmail Help.
☐	Test message arrives in Gmail with the right label.
☐	Reply from the same address set.

LECTURE 3.6 · OPTIMISE

Turn on free SSL (https)

SSL encrypts the link between your visitor and your site. It shows a padlock and changes http to https. Browsers warn people when a site has no SSL.

Pillars: Optimise

Why it matters

- Data sent through the site is encrypted, which protects logins and forms.
- Browsers show a padlock, which builds trust.
- Search engines have said HTTPS is a small ranking signal. Do not expect it to fix rankings on its own.

1. Sign in to Bluehost and go to My Sites.
2. Find your site, then click Manage Site.
3. Click the Security tab.
4. Turn on Free SSL Certificate.
5. Wait for it to finish. It often takes about an hour. If it takes longer, contact Bluehost support.

Check it works

1. Open your site address and check it starts with https://.
2. Check for the padlock in the address bar.
3. Open an inner page too, and check it is also secure.

WATCH OUT

If you see a mixed content warning, an image or script is still loading over http. Replace its address with https.

KNOWLEDGE CHECK

1. What does the padlock show? (Answer: the connection is encrypted.)
2. Where do you turn on SSL? (Answer: Manage Site, then Security.)

Common mistakes

- Turning on SSL and not testing a private window.
- Keeping http links in images or buttons.

Lecture completion checklist

Done	Item
☐	SSL is on.
☐	Padlock shows on the home and inner pages.
☐	No mixed-content warning in the browser console.

LECTURE 3.7 · APPLY (DEADLINE)

Verify your domain (do this first)

Your domain registration needs a verification click. ICANN rules set a verification window for registrars (the master prompt cites 15 days). Your registrar's email states the exact deadline for your domain. Follow that email, and do it today.

Pillars: Apply

Find the three emails

1. **Welcome email:** your login details. Save them safely.
2. **Order complete:** your receipt.
3. **WHOIS verification:** the email titled something like One last step to activate your domain.

1. Check your inbox, then your spam and promotions folders.
2. Open the WHOIS verification email.
3. Click Verify Your Email.
4. Check the confirmation page says the verification is complete.

WATCH OUT

If you miss the deadline, your domain can be suspended. Read the exact deadline in your email and set a reminder.

Learn more about the rules for domain contact details on ICANN (icann.org).

KNOWLEDGE CHECK

1. Where do you find the verification email? (Answer: your inbox, or spam and promotions.)
2. What happens if you do not verify? (Answer: the domain can be suspended.)

Common mistakes

- Missing the email in spam.
- Assuming the 15-day or 14-day rule is the same for every registrar.

Lecture completion checklist

Done	Item
☐	Verification email found.
☐	Verification link clicked.
☐	Status checked in the registrar dashboard.

LECTURE 3.8 · APPLY

Assignment and final project

Build the site, check the security and email, then share your work.

Pillars: Apply

Your assignment

1. **Launch a site.** Build a business site, or a practice portfolio, with Bluehost, Astra and Elementor.
2. **Check security and email.** Confirm the domain is verified, the https padlock shows, and your business email reads in Gmail.
3. **Share your work.** Post your site link in the Skillnavora learner community to get feedback.

Final project submission

Item	What to send
Live site link	Your https:// address
Screenshot: home page	Desktop view
Screenshot: phone view	Your site on a phone
Screenshot: padlock	The address bar with the padlock
Screenshot: Gmail	One business email in your Gmail inbox
Short note	Three things that were hard and how you fixed them

Practice: troubleshoot like a pro

Problem	What to check
Site shows Coming Soon	Launch the site from the dashboard
No padlock	SSL turned on? Wait longer, then check again
Gmail will not connect	Try Method 2. Check the server and port
Filter does not work	Was the From field left blank?
Domain warning	Verify the WHOIS email now

SELF CHECK

Can you say in your own words what hosting, domain, SSL and a theme each do? If yes, you are ready for Chapter 4.

Common mistakes

- Launching before the link and form tests pass.
- Leaving placeholder text on the live site.

Lecture completion checklist

Done	Item
☐	All 14 requirements from the spec are done.
☐	Submission template completed.
☐	Site shared with the learner community.

SECTION 16 · WORKBOOK

Practical technical workbook

Printable and fillable worksheets. Each box has a tick box or a blank line.

A. Domain selection worksheet

Option	Name	Short? Easy to spell? No hyphen?	Available? (check the registrar)
1		☐ ☐ ☐	☐
2		☐ ☐ ☐	☐
3		☐ ☐ ☐	☐

B. Website structure planner (agency example)

Page	Purpose	In the menu?
Home	Say who you are and what you offer	☐ yes
About Us	Build trust with your story	☐ yes
Services	List what you do and for whom	☐ yes
Contact Us	Make it easy to reach you	☐ yes
Blog	Share useful articles	☐ yes

C. Email account planner

Address	Used for	Display name	Created
info@	General questions		☐
sales@	Enquiries about services		☐
support@	Help for clients		☐

D. Configuration log

Setting	Value you chose	Done
Permalinks	Post name	☐
Theme and starter template		☐
Header logo		☐
Footer details		☐
Menu order		☐
SSL on (https padlock)		☐
Domain verified		☐

REFERENCE

Troubleshooting

Use this table when a step does not work.

What you see	Likely cause	Fix
Page not found after you change the permalink	Permalinks not saved	Settings, Permalinks, Save Changes
Template did not import	Plugin not updated or not active	Check the plugin is active and updated, then try again
Padlock is missing	SSL not yet active	Enable it under Security, wait, then check
Mixed content warning	Some content loads over http	Change the link to https
Email goes to spam	New sender or no setup	Send to yourself first, mark as not spam, and use a clear subject

PLEASE CHECK FIRST

Screens, menu names and plugin versions change. The links in this chapter were not checked live from this workspace. Confirm each one on its official site.

SECTION 18 · GLOSSARY

Technical glossary

Beginner-friendly meaning and an example for each term.

Term	Meaning and example
CMS	Content management system. Software that lets you build and edit a site without coding. Example: WordPress.
Domain	Your web address, such as yourbrand.com. Example: the name you type in a browser.
Hosting	A service that keeps your site files online 24 hours a day. Example: your Bluehost plan.
DNS	Domain Name System. It turns a name into the server address. Example: it points yourbrand.com to your host.
Nameservers	The DNS servers your domain uses to find your host. Example: two names your registrar gives you.
SSL / TLS	Encryption for connections between a browser and a server. Example: the padlock on your site.
HTTPS	The secure version of http. Example: https://yourbrand.com.
WordPress.org	The free, self-hosted WordPress software. Example: the version in this course.
WordPress.com	A hosted service run by a company. It has plan limits. Example: a site that cannot use some plugins on a basic plan.
Theme	The design of the site. Example: Astra.
Plugin	An add-on that adds one feature. Example: a contact form.
Elementor	A drag-and-drop page builder. Example: editing a heading by clicking it.
Astra	A WordPress theme. Example: the base design you install first.
Permalinks	The web address pattern of each page. Example: post name makes /about-us.
POP3	A mail setting that brings messages from a mailbox into another app. Example: fetching mail into Gmail.
IMAP	A mail setting that keeps messages on the server and syncs folders. Example: reading mail on a phone and laptop together.
SMTP	The setting that sends outgoing mail. Example: sending as a business address from Gmail.
Webmail	Mail you read in a browser. Example: the Bluehost webmail page.
Email forwarding	Passing mail from one address to another. Example: business mail copied to a Gmail inbox.
MX records	DNS records that say where mail for a domain goes. Example: they point mail to your host's mail server.
SPF	A DNS record that lists which servers may send mail for your domain. Example: it helps stop spoofed mail.
DKIM	A signature added to outgoing mail, checked with a DNS key. Example: proof the mail was not changed.
DMARC	A policy that tells receivers what to do when SPF or DKIM fails. Example: send reports to you.

WHOIS	A public record of who registered a domain. Example: the contact details you verify.
Responsive design	A layout that adjusts to phone and desktop screens. Example: the menu becomes a tap button on a phone.
SEO	Search engine optimisation: making pages easy to find and understand. Example: clear titles and headings.
Website migration	Moving a site to a new host or domain. Example: moving the WordPress files and database to another host.

FINISH · CHECKLIST

Final website launch checklist

Test everything before you say the site is live.

Done	Test	How
☐	Every menu link opens the right page	Click each one, on desktop
☐	Links inside pages work	Click each button and text link
☐	Contact form sends a message	Send a test to yourself
☐	Mobile layout is readable	Open on a phone, or use browser device view
☐	Address starts with https://	Check the padlock
☐	No mixed-content warning	Open browser developer tools, Console tab
☐	Private window shows the same site	Open a private or incognito window
☐	Site is no longer in Coming Soon mode	Check the dashboard
☐	Speed looks acceptable	Run PageSpeed Insights

FINISH · SUBMISSION

Final project submission template

Copy this page, fill it in and send it to your reviewer or the learner community.

Field	Your answer
Website name	
Live URL (https://)	
Homepage screenshot (attached)	☐
Mobile screenshot (attached)	☐
SSL evidence (padlock screenshot)	☐
Domain verification status	☐ verified ☐ pending
Pages created (list at least five)	
Business email status	☐ created ☐ connected to Gmail ☐ not used
Challenge 1	
Challenge 2	
Challenge 3	
Lesson 1	
Lesson 2	
Lesson 3	

ASSESSMENT

Assessment rubric

Self-check or reviewer check. Total is 100 points.

Area	Weight	Score (0 to weight)
Website structure and navigation	15%	
Visual design and branding	15%	
Mobile responsiveness	15%	
Content quality	10%	
SSL and security configuration	15%	
Domain configuration and verification	10%	
Email configuration	10%	
Functionality and testing	10%	
Total	**100%**	

FINISH · RESOURCES

External tools and resources

Official sources first. Each link was not checked live from this workspace. If a link fails, search the page title on the same site.

Resource	Use it for	Link
WordPress documentation	Core features and dashboard help	wordpress.org/documentation
WordPress.com support	Comparing the hosted service	wordpress.com/support
Bluehost help	Hosting, domain, SSL, email	www.bluehost.com/help
Astra documentation	Theme settings	wpastra.com/docs
Elementor help	Page builder	elementor.com/help
Gmail Help	Email settings and forwarding	support.google.com/mail
Google Workspace Admin Help	Business email options	support.google.com/a
ICANN	Domain registration rules	www.icann.org
Google Analytics developer docs	Measurement later in the course	developers.google.com/analytics

FINISH · CERTIFICATE

Chapter completion certificate (template)

Fill in when you finish the final project and the rubric scores at least 70 out of 100.

Certificate of completion

This certifies that _____ completed **Chapter 3: Make a Website (WordPress)** in The Complete Digital Marketing Course by SkillNavora.

Date: _____ Score: _____ / 100

Reviewer: _____

This is a SkillNavora completion certificate. It is not an accredited qualification.

FINISH

Completion checklist

Tick each item as you finish it.

Done	Item
☐	I can explain WordPress.org and WordPress.com (3.1, 3.2)
☐	My domain and hosting are set up (3.3, Step 1)
☐	WordPress is open, permalinks set to Post name (3.3, Step 2)
☐	Astra and a starter template are imported (3.3, Step 3)
☐	Header, footer, a new page and the menu are done (3.3, Step 4)
☐	Business email created and tested (3.4)
☐	Email reads in Gmail (3.5)
☐	SSL is on and the padlock shows (3.6)
☐	Domain verification is done (3.7)
☐	Site is launched and shared (3.8)
