Module 5: UX and Design Collaboration

Detailed supplement: a UX review method, the heuristics and UX laws, and five case studies with redesign and validation plans

Written by Varun Kumar, for SkillNavora · Draft

Official site: www.skillnavora.in

Prepared for Skillnavora — Learn. Practise. Implement. Grow.

MODULE 5 · HOW TO USE THIS SUPPLEMENT

Coverage map: what is new and what is already in the module

The handbook covers usability, wireframes, handoff and accessibility. It does not contain the UX case studies. This supplement adds the review method, the heuristics and laws behind the findings, and five case studies from the source decks.

Topic	Handbook section	Status here
Heuristic evaluation method	5.x (partial)	New: five steps from plan to validation
Ten usability heuristics	5.x (named only)	Extended: the heuristics used in the cases, with examples
UX laws: Hick's and Fitts's	—	New: what each law says and when it matters
Severity scale	—	New: the 1 to 3 scale, with a 4 for blockers
Zomato ordering flow (case)	—	New: four issues, with fixes and a validation plan
Klook package flow (case)	—	New: discovery, configuration and error recovery
Nykaa journeys and user perspectives (case)	—	New: five journeys and what three non-PM users said
OYO detailed report (case)	—	New: structure of the report and how to read it

NOTE ON THE SOURCE

The case studies are independent evaluations of public screens. They are opinions based on the author's walkthroughs, not data from the companies. Prices and screens may have changed; check the live product before you quote them.

NEW · METHOD

A UX review in five steps

A heuristic review checks a flow against a short list of usability principles. Each step gives evidence, so every finding can be checked by someone else.

The five steps of a heuristic review

1. **Plan:** choose one flow, the goal, and the users you will represent.
2. **Walk the flow:** go through it as a real user, and capture each friction point with a screenshot.
3. **Score:** rate each issue for severity and name the heuristic it breaks.
4. **Redesign:** propose one change per issue, and say which heuristic it fixes.
5. **Validate:** test with six to eight people using short tasks, and watch the guardrails in live data.

EXTENDED · HEURISTICS

The usability heuristics used in the cases

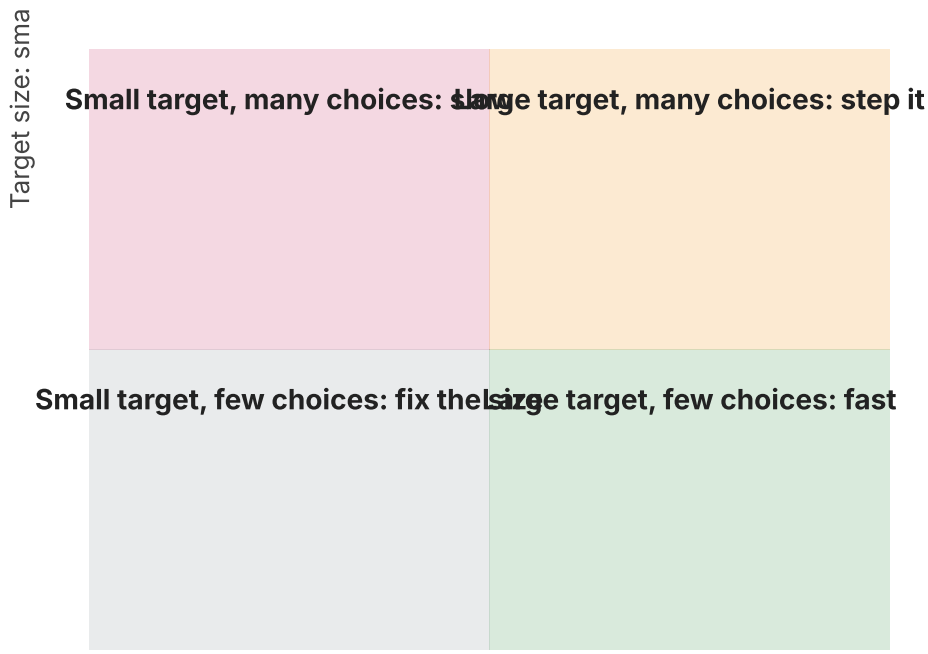

No.	Heuristic	What to check
1	Visibility of system status	Does the screen show what is happening, such as totals or progress?
2	Match between system and real world	Does the language match how people speak and shop?
5	Error prevention	Does the design stop mistakes before they happen?
6	Recognition rather than recall	Can people see their options without remembering them?
8	Aesthetic and minimalist design	Is there only the information needed at this step?

The numbers match the standard list of ten heuristics. The cases below cite them by number.

NEW · UX LAWS

Hick's law and Fitts's law

Hick's law: the time to decide grows with the number of choices. Reduce the choices on screen, or step them into a wizard. **Fitts's law:** the time to reach a target depends on its distance and size. Make tap targets big and close to the thumb on phones.

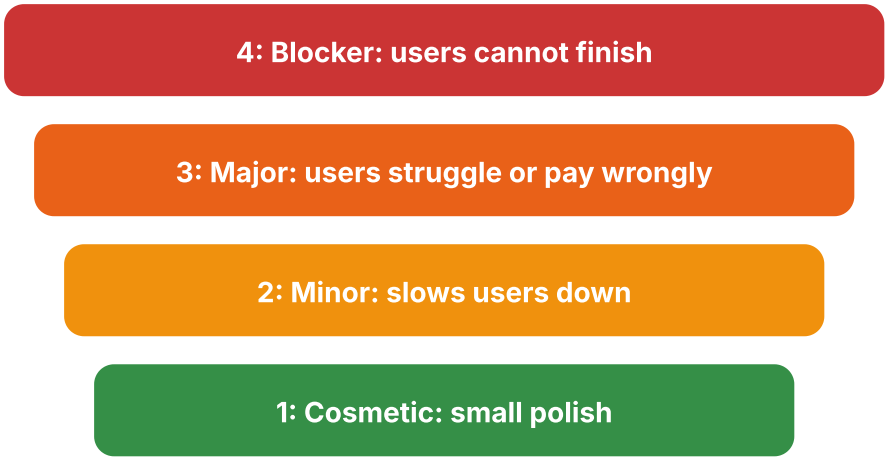

Hick's and Fitts's laws together

NEW · SEVERITY

Scoring severity

The cases use a 1 to 3 scale from the source decks, and this supplement adds 4 for blockers:

Severity scale for UX findings

PRIORITY MATRIX

Plot each issue by how often it happens and how much it hurts. Fix the frequent, high-impact issues first.

CASE STUDY · ORDERING FLOW

Zomato: four issues, with fixes

A heuristic review of the customer ordering flow, from the menu to payment. Each issue names the heuristic it breaks and the fix.

Issue	Severity	Heuristic	Fix
Too many price and offer signals compete on the menu and cart.	3 (major)	8 Aesthetic and minimalist; 6 Recognition over recall	One price line per item; the deal rule once per section; state plainly whether a second coupon can stack
A floating Menu button covers the Add button.	2 (minor)	5 Error prevention (Fitts's law)	Move the button above the cart bar or hide it while scrolling; add bottom padding
The bill breakdown is one tap away.	1 (cosmetic)	1 Visibility of system status	Show a one-line split next to the pay button
'Add-ons' mixes options with full-price upsells.	2 (minor)	2 Match with the real world; 8 Minimalist	Separate 'Make it yours' options from upsells

The source also covers a restaurant partner's journey (registration, documents and payout). Use the same method on the partner side.

CASE STUDY · VALIDATION PLAN

How to test the Zomato fixes before shipping

The plan tests both sides of the marketplace before any release.

Group	Tasks (think-aloud)	Measures	Live guardrails
Customers (6 to 8 people)	Order a meal under a set budget and say what you will pay; use a second coupon; add two items while scrolling the menu	Completion, time, mis-taps, correct cost explained, confidence from 1 to 7	Cancellations within two minutes; removed add-ons; average order value
Restaurant partners (5 to 6 owners)	Register an outlet with a sample menu; say what you will receive on a sample order; explain a lower payout	Completion, time to submit, first-time document pass rate, correct payout explained	Registration drop-off by step; time to go live; payout queries

CASE STUDY · PACKAGE BOOKING

Klook: discovery, configuration and error recovery

The review found that similar options are packed together, so users freeze when they decide. Four findings shaped the redesign:

Finding	Law or principle	Redesign recommendation
Package options, time configurations, transfer types and meal options cluster together	Hick's law: too many choices at once	A step-by-step configuration wizard that isolates the high-stakes choices
Guest adjustment controls are small and hard to tap on the move	Fitts's law	Larger tap areas for every primary configuration control
A pickup map is hard to read, with overlapping shapes and no clear feedback	Visibility of system status; match with the real world	A smart address check that says plainly whether the pickup is free
A promo error is a dead end	Error prevention and recovery	Contextual help that guides the user forward instead of a static pop-up

CASE STUDY · SHOPPING APP

Nykaa: five journeys and what users said

The review followed five journeys that a shopper takes: a notification alert on opening, finding a sunscreen for oily skin through menus, a product page, the video content section, and the account and wallet. It also spoke to three people outside product or design.

Journey	Goal	What worked and what did not
1. Notification alert	Get past the prompts to the home screen	A second prompt appears right after the first pop-up, with no easy way to close it; the user is nudged to say yes
2. Sunscreen search	Find a budget sunscreen for oily skin through menus	The category path is four steps deep before a product shows; the shop page leads with formulation, not skin type
3. Product page	Check the product is right for my skin	Clear layout; the two versions are shown side by side
4. Video content	Find real reviews and tutorials	Opening the feed is smooth; searching for a real swatch returns irrelevant tutorials and ads
5. Account and wallet	Check membership and loyalty rewards	The account screen is clean and the wallet shows rewards clearly; the Privé loyalty tiers are hard to understand

The companion analysis for the same app concludes that discovery and product trust are its strongest areas, while onboarding and checkout need the most work.

CASE STUDY · DETAILED REPORT

OYO: how to read a detailed UX report

The detailed report is a 23-page review. It is organised in the same order that a good UX report should follow:

1. **Users:** who the guests and owners are.
2. **Journeys:** the steps they take, with the friction at each step.
3. **Evidence:** screenshots, quotes and walkthrough notes.
4. **Guest issues and owner issues:** the findings for each side of the marketplace.
5. **Laws and benchmarks:** which UX laws apply, and how comparable products perform.
6. **Solutions:** one redesign per issue, with a test plan.

EXERCISE

Read the Evidence section. For one finding, write the heuristic, the severity, the fix, and the test that would show the fix works.

Quiz with answers

1. Name the five steps of a heuristic review.
   Answer: plan, walk the flow, score, redesign, validate.
2. What does Hick's law say?
   Answer: decision time grows with the number of choices; reduce or step them.
3. What does Fitts's law say?
   Answer: time to reach a target depends on its distance and size; make targets bigger and closer on phones.
4. Which heuristic number covers error prevention?
   Answer: 5.
5. Why test with six to eight people?
   Answer: a small group of short tasks finds most usability problems quickly; check guardrails in live data too.

MODULE 5 · FINAL

Completion checklist

Completion checklist

Done	Item
☐	Read the coverage map and the method
☐	Named the heuristic for four issues
☐	Scored severity on a 1 to 4 scale
☐	Wrote one redesign per major issue
☐	Planned a six to eight person test with guardrails
☐	Answered the quiz without notes

SkillNavora

Module 5 · Part B: UX and Design Collaboration

Class material on the product manager's role in UX: user stories, design thinking, usability testing, the UX components and laws, design systems and the assignment

Varun Kumar · SkillNavora

Prepared for Skillnavora — Learn. Practise. Implement. Grow.

PART B · SECTION 5.1

What this module teaches a PM, and what a PM owns

The goal is not to make you a designer. It is to make you fluent enough to talk with designers, to judge a flow, and to collaborate well. The deck lists five aims: explain what UX design is; describe its components; show the process a designer follows; teach the design vocabulary; and introduce the tools (for example Figma, Miro and user-testing tools).

What the PM owns in UX: defining the user problem clearly, bringing user insight into decisions, setting UX success metrics (conversion, completion), choosing simple experiences over complex ones, and collaborating closely with the design team.

A PM's role in UX, in five steps

WHAT A UX DESIGNER NEEDS (FROM THE DECK)

Universal design principles (colour, layout, typeface, white space); the design thinking process; human psychology and usability; UX laws and heuristics; enough technology to know what can be built; interaction and experience design (flows, journeys, edge cases, states); design tools; and practice.

PART B · SECTION 5.2

User stories and acceptance criteria

A user story is a short description of a feature from the user's side. The deck breaks a good story into five parts:

Part	What it does	Example (from the deck)
1. The story	Who wants what, and why	As a user, I want to save my delivery address, so that I can check out faster next time.
2. Acceptance criteria	When the feature counts as done (the most important part)	A user can add a new address; a user can edit or delete it.
3. Success metrics	How you will know the feature works	Share of checkouts that use a saved address
4. Edge cases	Scenarios that might break the experience	What if the saved address is no longer serviceable?
5. Business value	Why the business should build it	Faster checkout means more completed orders

PRACTICE

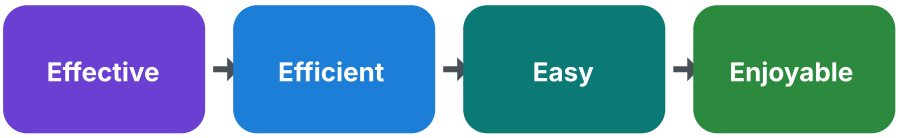

Write one story for the feature you are evaluating in the assignment. Give it at least three acceptance criteria and one edge case.

PART B · SECTION 5.3

What design and UX design mean

Design is about finding the best solution to a problem. It is far more than look and feel, and it is both art and science. The deck says every design rests on three components: **utility** (does it work), **beauty** (does it look and feel right) and **sustainability** (does it last).

UX design is the process of creating experiences that are **effective, efficient, easy and enjoyable**. The deck's example: a ride-hailing app adds bus booking. The whole booking journey is the experience. Designers ask: can users find and book a seat quickly? Is the interface simple and clear? Is the whole journey enjoyable?

The four qualities of a good UX

Design thinking is one common process for getting there. It is not the only one; several frameworks exist.

PART B · SECTION 5.4

Design thinking: five stages

Design thinking is a human-centred problem-solving framework. It starts from users' needs, wants, goals and motivations. The deck says it works for problems as large as climate change and as small as a button.

The five stages of design thinking

Stage	What it means in practice
1. Empathise	Understand users: their needs, pain points and behaviour
2. Define	State the core problem you are solving
3. Ideate	Generate many ideas and possible solutions
4. Prototype	Make simple versions to see how the solution works
5. Test	Validate with users; learn what works and what fails

The deck's live problem is the same signup drop from Module 4: sign-ups down 25 percent over three weeks, concentrated in the signup flow. Work through the five stages on it, and note which stage you would skip under time pressure, and why that is risky.

REMEMBER

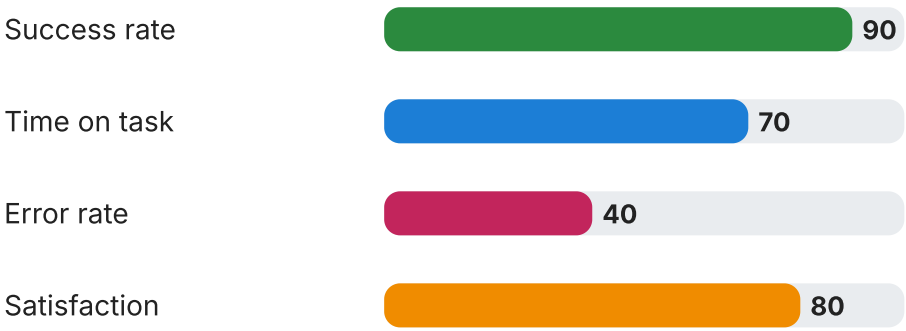

Design thinking is a problem-solving framework, not only a tool for designers. The PM uses the same five stages.

PART B · SECTION 5.5

Usability testing: four measures

Usability testing checks whether users can use a product. The deck measures four things:

Measure	Question it answers
Success rate	Could users complete the task?
Time	How long did the task take?
Error rate	How many mistakes did users make?
Satisfaction	How satisfied were users afterwards?

Measure all four together; the bars show only the idea

The deck's U.U.D framework (slide 36 in the class PDF) says every product, feature or function must answer three fundamental questions. The slide is in the visuals at the end of this PDF.

PART B · SECTION 5.6

The components of UX design

UX is a set of disciplines. Each one owns a different part of the experience. The deck introduces six, and their links are shown in the visuals at the end of this PDF.

Component	What it covers	Main output
UX research	Understand users' needs, goals, motivations and behaviour. Done before any design tool is opened. Methods: interviews, surveys, contextual enquiry. It finds the unsaid needs.	Insight and empathy
UI design	The look and feel of everything visible on the screen: colour, typography, layout, shapes, icons, images, illustrations, animation and copy.	Visual design
Information architecture (IA)	Categorise and label content and features in a logical order, so anyone can see how the product works.	A map of the product hierarchy
UX writing (microcopy)	Words on the screen: a branch of copywriting, chosen for the target users.	Clear labels, messages and prompts
Interaction design (IxD)	Define how the user and the product interact, so the interaction is simple and easy to understand.	Flows and behaviour rules
Accessibility	Design so that anyone can use the product, including users with disabilities.	Inclusive, usable screens

Connect the components to the assignment: a confusing field order is an IA problem, unclear error text is a UX writing problem, and a tiny tap target is an IxD and accessibility problem.

PART B · SECTION 5.7

Roles in a UX team

A UX team is made of several roles. You will work with most of them. The deck lists eight:

Role	Typical focus
UI designer (visual designer)	Look and feel of the screen
UX researcher	Understanding users through research
UX writer	Words and microcopy
Usability expert	Testing whether the product works for users
Accessibility expert	Making the product usable by people with disabilities
Interaction designer	How users and the product interact
Information architect	Structure and labelling of content
UX designer	Leads the end-to-end experience

As a PM, know which role owns which decision. A question about layout goes to the UI designer; a question about whether users can finish a task goes to the usability expert.

PART B · SECTION 5.8

The other 13 UX laws (Hick's and Fitts's are in Section 5.1 of the Module 5 PDF)

The deck lists fifteen UX laws. Hick's law (1) and Fitts's law (2) are already explained earlier in this module, so they are not repeated here. The table below covers the other thirteen.

Law	What it says	Example (from the deck)
3. Miller's law	Working memory holds about seven items (plus or minus two).	Shorter forms with fewer fields reduce drop-off.
4. Aesthetic-usability effect	Attractive designs are seen as more usable, even when they are not faster.	Clean, minimal product design.
5. Jakob's law	Users expect your product to work like the others they already use.	Standard icons for common actions.
6. Parkinson's law (applied to UX)	Design complexity tends to expand to fill the space available.	Minimalism prevents over-designed screens.
7. Postel's law (robustness)	Accept many input formats, and still work correctly.	Input validation and clear error handling.
8. Tesler's law (conservation of complexity)	Complexity cannot be removed, only moved from one part of the system to another.	A simpler interface can need a more complex back end.
9. Goal-gradient effect	People work harder as they near the goal.	Progress bars in checkout.
10. Serial position effect	People remember the first and last items best.	Put key items at the start and end of a menu.
11. Information scent	Visual and text cues should match what users are looking for.	Labels that lead to the right content.
12. Figure-ground	People separate objects from the background.	Contrast to make a button stand out.
13. Law of proximity	Items close together are seen as related.	Grouping related links or buttons together.
14. Von Restorff effect (isolation)	The item that stands out is remembered.	A bold colour for the main call to action.
15. Picture superiority effect	Pictures are remembered better than words.	Icons and illustrations that aid navigation.

Use the laws as a checklist when you evaluate a flow. For each issue you find, name the law it breaks. The assignment asks for at least three issues mapped to laws.

PART B · SECTION 5.9

Design systems

A design system is a collection of reusable components, guidelines and resources. It keeps products consistent. The deck's examples: monday.com's Vibe design system, Google's Material Design and Apple's Human Interface Guidelines.

- Components: buttons, forms, cards and navigation that teams reuse.
- Guidelines: when and how to use each component.
- Resources: colours, type and spacing as shared tokens.

PM POINT OF VIEW

A design system speeds up delivery and keeps the experience consistent. Ask the design team which components already exist before you request a new one.

PART B · SECTION 5.10

Working well with the UX team

The deck gives these tips for a PM working with designers:

1. **Speak a common language:** learn the basic principles and terms, so discussions are clearer.
2. **Involve designers early:** do not wait until the roadmap is final. Their insight shapes the product vision.
3. **Value the designer's expertise:** ask for their ideas throughout the process.
4. **Learn the tools and workflows:** know the basics of the design tools the team uses.

The deck continues with further tips; they appear in the visuals at the end of this PDF.

The UX evaluation and redesign assignment

The assignment helps you apply heuristics and UX laws to a real interface, and think like a PM and a UX designer.

1. Choose **one key user flow**, for example food ordering, checkout, signup or login, or a booking flow.
2. Prepare a **5 to 7 slide presentation** (PPT or PDF) with screenshots and the table below.
3. Evaluate the flow: find **at least five issues** against Nielsen's ten heuristics, and **map at least three issues** to UX laws.
4. Suggest a fix for each issue.

Issue	Heuristic violated	How to improve
All fields look similar; no clear starting point	Aesthetic and minimalist design	Highlight the primary fields; group them or use a step-wise flow; make the first action visually dominant
Date fields are red, but no explanation is given	Visibility of system status; error recovery	Add an inline message (for example, 'Please select a departure date'); show it only when the user interacts

The second row is the deck's worked example. Use the same three columns for your own issues.

SELF-CHECK

Did you name the flow and its goal? Does each issue name a heuristic and a fix? Did at least three issues map to a UX law? Is every screenshot labelled?

PART B · CHECK YOUR UNDERSTANDING

Quiz with answers

1. Name the four measures of usability testing.
   Answer: success rate, time, error rate and satisfaction.
2. What are the five stages of design thinking?
   Answer: empathise, define, ideate, prototype, test.
3. What must a user story's acceptance criteria say?
   Answer: when the feature counts as done.
4. Which UX component decides the words shown on screen?
   Answer: UX writing (microcopy).
5. Which law says people remember the item that stands out?
   Answer: the Von Restorff (isolation) effect.
6. How many issues and laws must the assignment cover at minimum?
   Answer: at least five heuristic issues, and at least three mapped to UX laws.

PART B · FINAL

Completion checklist

Completion checklist

Done	Item
☐	Wrote one user story with acceptance criteria and an edge case
☐	Ran the five design thinking stages on the signup problem
☐	Named the four usability measures and how you would collect each
☐	Matched each UX component to a real screen problem
☐	Mapped three UX laws to issues you found
☐	Completed the one-flow evaluation table

MODULE 5 · COMPLETE CLASS NOTES

Everything else from the class slides

Every point from the class slides that is not already explained earlier in this PDF, grouped by slide. Points already covered are not repeated.

Class · slide 1 The Role of Product Manager in UX Design

- The Role of Product Manager in UX Design
- Bring user insights and context into decisions
- Prioritize simple and intuitive experiences over complexity
- Collaborate with designers by giving context, not designs
- Validate UX using data, feedback, and user behavior A Product Manager is not responsible for designing screens, but is responsible for the quality of experience.
- The Product Manager's ultimate role in the design stage is to collaborate with designers with respect to the queries they will have regarding the user story.

Class · slide 3 What is a User Story?

- Acceptance Criteria (Very Important): Defines when the feature is considered "done".
- Success Metrics: How you measure if this feature is successful.
- Business Impact: Why this matters for the company.
- A user story is a description of a feature/functionality written from the user's point of view, explaining what they want, why they want it and how success will be measured.
- It contain below sections:

Class · slide 4 What is a User Story?

- Acceptance Criteria (Very Important): Defines when the feature is considered "done". - User can add a new address - User can edit/delete saved addresses - Address is auto-filled during checkout - Validation for required fields (PIN, city, etc.) - User should have option to add New Address in the checkout page
- Success Metrics: How you measure if this feature is successful. - % of users saving an address - Reduction in checkout time - Increase in checkout conversion rate
- Edge Cases: Scenarios that might break the experience. - Invalid PIN code - Duplicate address - No internet connection
- Business Impact: Why this matters for the company. - Faster checkout → higher conversion - Better experience → higher retention

Class · slide 5

The Goal of this module

- Give a brief about the different components of UX Design
- Make you aware of the processes, UX Designer goes through while creating the experiences
- Make you aware of the lingos Designer use so that you as a PM can have effective communication with Designer
- Give a brief overview of the different tools used by Designer such as figma, miro, user testing etc. so that you can collaborate with them effectively Important: This module will make you sufficiently equipped with design tools and techniques - without turning you into a designer!
- What are your expectation from this session?

Class · slide 6

If you still insist to become a UX Designer, you will

- If you still insist to become a UX Designer, you will need master these
- Universal Design Principles: (Color Psychology, Layout and Composition, Typeface, White Space Mgmt. etc.)
- Design Thinking & UX Process: (Method in the madness, From problem → solution → validation)
- Human Psychology & Usability: (How human think, decide, and/or make mistakes)
- UX Laws & Heuristics: (Why some designs feel intuitive and others frustrating)
- Technology Understanding: (What can actually be built, and how systems behave)
- Design Tools: From Abstract to realism And most importantly... Relentless Practice, Practice and Practice for years

Class · slide 7

Sample PM Question on UX Design

- Sample PM Question on UX Design
- How would you improve the user experience of a product you use daily?
- Design a food delivery app for Tier-2 cities.
- Design a vending machine for Blind People
- How would you improve onboarding for a new SaaS product?
- Design a feature for WhatsApp to improve group conversations.
- Here is the framework to answer these question: Design Thinking + Product Thinking + Metrics
- Define the user (Empathize)
- Define the problem (Define)

Class · slide 8

Who is the greatest designer

- Who is the greatest designer ever?

Class · slide 13

What is Design?

- Design is all about finding the best solutions to the problem
- Design is far far more than the look and feel

Class · slide 14

3 Key components of Design

- 3 Key components of Design Utility Beauty Sustainability

Class · slide 15 **What is UX Design?**

- Design UX Design Fashion Design Graphic Design

Class · slide 17 **Example**

- Example Say uber want to create a feature using which their users will be able to book buses as well

Class · slide 18 **Example**

- The complete journey of Booking a seat is an experience

Class · slide 19 **Example**

- To make sure that users can easily find and book the seats

Class · slide 20 **Example**

- To make sure that users can book the seat quickly

Class · slide 21 **Example**

- To make sure that the interface is easy simple, clean and easy to understand and navigate

Class · slide 22 **Example**

- To make sure that the complete journey of booking is enjoyable

Class · slide 24 **Example**

- Example UX Design is a process of creating experience which are effective, efficient, easy and enjoyable. "UX Design is a process" "Design Thinking is that process" Note: Design Thinking is not the only one we can use, there are multiple different frameworks available such as Double Diamond.

Class · slide 25 **Design Thinking**

- Design Thinking Section 3:

Class · slide 26 **Design Thinking**

- Design Thinking Design Thinking is a human-centric problem-solving framework.
- It emphasises on understanding user's needs, wants, goals and motivation while creating the solutions.
- Design thinking can be used to solve problems as big as climate change and as small as what color to use for the buttons in your UI.

Class · slide 27

Design Thinking

- Design Thinking Stage 1 Empathi ze Stage 2 Defin e Stage 3 Ideat e Stage 4 Prototy pe Stage 5 Testi ng It's is a problem-solving framework, not just a tool for a designer.

Class · slide 28

Design Thinking LIVE

- Design Thinking LIVE For this Live session here is the problem statement Over the past 3 weeks, user signups have declined by 25%, resulting in reduced new user acquisition and impacting growth targets.
- The drop appears to be concentrated in the signup flow, but the root cause is unclear.

Class · slide 30

Design Thinking

- Design Thinking Clearly define the core problem you are trying to solve.

Class · slide 31

Design Thinking

- Design Thinking Generate multiple ideas and possible solutions to the problem.

Class · slide 32

Design Thinking

- Design Thinking Create simple versions of your solution to explore how it works.

Class · slide 33

Design Thinking

- Design Thinking Validate your solution with users and learn what works or fails.

Class · slide 34

Usability Testing

- Usability Testing Usability Testing is a method of validating the usability of the product.
- Usability Testing are measure in following terms;
- Success rate: Whether users were able complete a task
- Time: How long it takes for users to complete a task
- Error rate: How many errors users made
- Satisfaction: How satisfied users were

Class · slide 68

15 most commonly used UX Laws

- 15 most commonly used UX Laws

Class · slide 69

UX Laws 1: Hick's Law

- UX Laws 1: Hick's Law Hick's Law is a principle in user experience design that states that the time it takes for a person to make a decision increases with the number of options they have to choose from.
- In other words, the more options you give someone, the longer it will take for them to make a decision.
- A practical example of Hick's Law in action is the Google homepage

Class · slide 70

UX Laws 2: Fitt's Law

- UX Laws 2: Fitt's Law Fitt's Law is a principle in user experience design that states that the time it takes to move to a target depends on the distance to the target and the size of the target.
- In other words, the larger and closer a target is, the easier it is to hit.
- A practical example of Fitt's Law in action is the size and placement of navigation links on a website.

Class · slide 71

UX Laws 3: Miller's Law

- UX Laws 3: Miller's Law Miller's Law is a principle in cognitive psychology that states that the average person can only hold 7 (plus or minus 2) items in their working memory at any given time.
- In other words, our capacity for processing information is limited and we can only handle a certain amount of information at once.
- A practical example of Miller's Law in action is in the design of forms or surveys.
- By limiting the number of questions or fields on a form, you can make it easier for users to complete the form and reduce the likelihood of errors or user drop-off.

Class · slide 72

UX Laws 4: The Aesthetic-Usability Effect

- UX Laws 4: The Aesthetic-Usability Effect The Aesthetic-Usability Effect is a principle in user experience design that states that users perceive aesthetically pleasing designs as more usable and efficient, even if they are not necessarily easier to use.
- In other words, users are more likely to view an attractive design as being more user-friendly and enjoyable to use, even if it doesn't necessarily make the user's tasks faster or more efficient.
- A practical example of the Aesthetic-Usability Effect in action is the design of Apple products, which are often praised for their sleek and minimalist design.

Class · slide 73

UX Laws 5: Jakob's Law

- UX Laws 5: Jakob's Law Jakob's Law is a principle in user experience design that states that users expect a website or app to work the way other websites or apps work.
- In other words, users bring their past experiences with similar products or interfaces to their current experience, and they expect the same patterns and conventions to apply.
- A practical example of Jakob's Law in action is the use of standardized icons for common actions or features.

Class · slide 74

UX Laws 6: Parkinson's Law

- UX Laws 6: Parkinson's Law While Parkinson's Law is more commonly associated with time management, it can also be applied to user experience design.
- In the context of UX, Parkinson's Law can be interpreted as the idea that the complexity of a design will often expand to fill the space available for it, potentially leading to over-designed or cluttered interfaces.
- A practical example of Parkinson's Law in UX design is the use of minimalism and simplicity to create a more effective user experience.

Class · slide 75

UX Laws 7: Postel's Law

- UX Laws 7: Postel's Law Postel's Law, also known as the "Robustness Principle," is a principle in computer network design.
- This law can be applied to a variety of design scenarios, such as software design, API design, or web design.
- For example, a web application should be designed to be tolerant of different user agents, browsers, or input formats, so that it can handle unexpected input and still function correctly.
- A practical example of Postel's Law in action is the use of error handling and input validation in software design.

Class · slide 76

UX Laws 8: Tesler's Law

- UX Laws 8: Tesler's Law Tesler's Law, also known as The Law of Conservation of Complexity, is a principle in user experience design that states that the complexity of a system is fixed and can't be reduced, only shifted from one part of the system to another.
- In other words, reducing complexity in one part of a system will inevitably increase complexity in another part of the system.
- For example, simplifying the user interface of a software application might make it easier for users to complete tasks, but could increase the complexity of the underlying system architecture required to support that user interface.

Class · slide 77

UX Laws 9: Goal-Gradient Effect

- UX Laws 9: Goal-Gradient Effect The Goal-Gradient Effect is a phenomenon in psychology and user experience design that suggests that people are more motivated to complete a task as they get closer to the end goal.
- In other words, as people progress toward a goal, their motivation to continue and complete the task increases.
- A practical example of the Goal-Gradient Effect in action is the use of progress bars in e-commerce sites.

Class · slide 78

UX Laws 10: Serial Position Effect

- UX Laws 10: Serial Position Effect The Serial Position Effect is a cognitive phenomenon that suggests that people tend to remember the first and last items in a series more easily than the items in the middle.
- This effect is important in UX design because it emphasizes the importance of carefully structuring and ordering the content in an interface to optimize users' memory of the information presented.
- A practical example of the Serial Position Effect in action in UX design is the design of a navigation menu.

Class · slide 79

UX Laws 11: Information Scent

- UX Laws 11: Information Scent Information Scent is a principle in UX design that refers to the degree to which the information scent (i.e., the visual and textual cues) of a website or application matches the user's information needs.
- The goal of information scent is to help users quickly find the information they are looking for by providing visual and textual cues that lead them to relevant content.

Class · slide 80

UX Laws 12: Figure-Ground

- UX Laws 12: Figure-Ground The Figure-Ground principle is a basic principle of perception that suggests that people perceive objects or figures in a visual scene as being distinct from the background or "ground".
- This principle is important in UX design because it can help designers create interfaces that are easier to understand and navigate.
- A practical example of the Figure-Ground principle in action in UX design is the use of contrasting colors or visual cues to make elements of an interface stand out from the background.

Class · slide 81

UX Laws 13: Law of Proximity

- UX Laws 13: Law of Proximity The Law of Proximity is a principle of perception that suggests that people tend to group together elements or objects that are physically close to each other.
- A practical example of the Law of Proximity in action in UX design is the use of visual groupings to indicate related content or elements.
- For example, designers may group related links or buttons together within a specific area of a webpage or app screen, making it clear to users that these elements are related and belong together.

Class · slide 82

UX Laws 14: Von Restorff Effect (or Isolation

- UX Laws 14: Von Restorff Effect (or Isolation Effect): The Von Restorff Effect, also known as the Isolation Effect, is a phenomenon in psychology and user experience design that suggests that people are more likely to remember items or elements that stand out from their surroundings.
- In other words, when presented with a group of similar items, people are more likely to remember the one that is different or distinctive.
- A practical example of the Von Restorff Effect in action in UX design is the use of bold or contrasting colors to draw attention to important elements or calls to action.

Class · slide 83

UX Laws 15. Picture Superiority Effect

- Picture Superiority Effect The Picture Superiority Effect is a cognitive phenomenon that suggests that people tend to remember visual information, such as pictures or images, more easily and more accurately than verbal or written information, such as text or spoken words.
- In other words, people tend to retain information better when it is presented in a visual format, rather than a verbal or written format.
- A practical example of the Picture Superiority Effect in action in UX design is the use of visual aids, such as icons or illustrations, to help users navigate an interface or understand complex information.

Class · slide 84

Design System

- Design System Section 6:

Class · slide 85

What is a Design System?

- A design system is essentially a collection of reusable components, guidelines, and resources that helps teams create consistent and user-friendly digital products.
- Example: Vibe design system by monday.com

Class · slide 86

Example:

- Example: Google Material Design Apple Human Interface Design

Class · slide 89

Collaborate with Designers as a Product Manager

- Collaborate with Designers as a Product Manager
- Speak a common language: Familiarize yourself with basic design principles and terminology.
- This will help bridge the communication gap and facilitate better discussions.
- Involve designers early in the product development process: Don't wait until the product roadmap is finalized to bring designers on board.
- Their insights can be valuable in shaping the product vision and features.
- Value the designer's expertise: Recognize the designer's skills and knowledge as essential for creating successful products.
- Encourage their input and ideas throughout the process.
- Learn about design tools and workflows: Having a basic understanding of design software and processes can help you better appreciate the designer's work and collaborate more effectively.

Class · slide 90

Assignment: UX Evaluation & Redesign

- Assignment: UX Evaluation & Redesign The goal of this assignment is to help you:
- Apply Usability Heuristics (Nielsen's 10 principles)
- Apply UX Laws (Hick's, Fitt's, Jakob's, etc.)
- Develop the ability to critically evaluate real user interfaces
- Think like a Product Manager / UX Designer
- Booking flow Submission Format: Prepare a 5-7 slide presentation (PPT / PDF) with screenshots of the experience and in the tabular format given in next slide
- Perform UX Evaluation Analyze the selected flow using: A.
- Identify at least 5 issues B.
- Map at least 3 issues to UX Laws Task Overview You are required to:
- Select any 1 digital product (Mobile app or web app) Examples:
- SaaS product (like Notion, Slack, etc.) Assignment

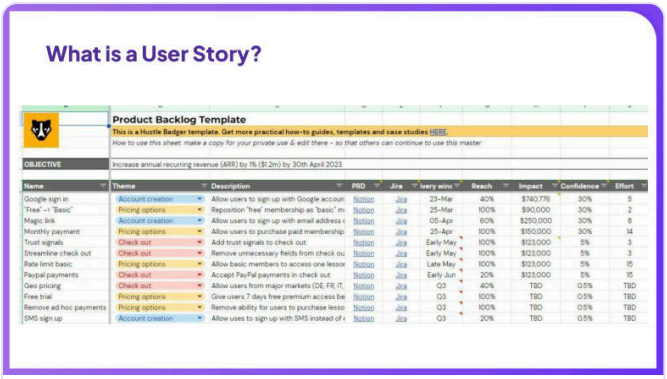

Class · slide 91

Assignment Submission Format

- Use grouping or step-wise flow
- Add inline error message "Please select departure date"

Visual slides from the class

These slides are mostly pictures and diagrams, so they are shown as images. Read them with the notes above.

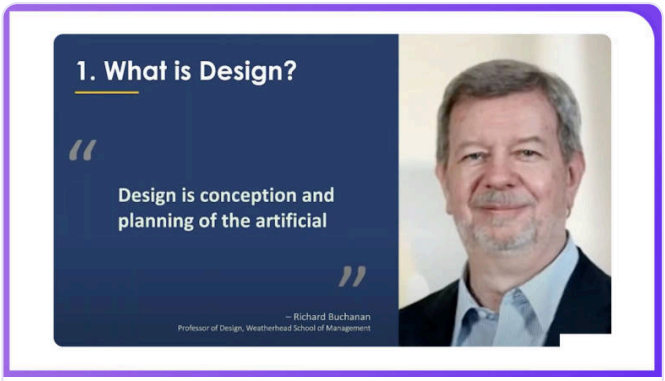

Slide 2

Slide 8

Slide 9

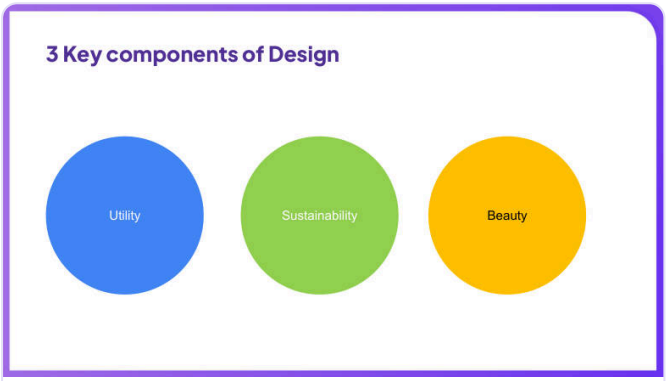

Slide 10

Slide 11

Slide 12

Slide 14

Slide 15

"UX Design is a process of creating experiences which are effective, efficient, easy and enjoyable."

Slide 16

Example

Say uber want to create a feature using which their users will be able to book buses as well

Slide 17

Example

*UX Design is a **process** of creating experience which are effective, efficient, easy and enjoyable.*

But what about the process??

Slide 23

Section 3:

Design Thinking

Slide 25

Design Thinking

Understand your users — their needs, pain points, and behavior.

Slide 29

Design Thinking

Clearly define the core problem you are trying to solve.

Slide 30

Design Thinking

Generate multiple ideas and possible solutions to the problem.

Slide 31

Design Thinking

Create simple versions of your solution to explore how it works.

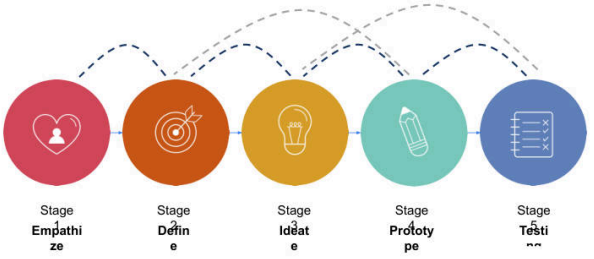

Slide 32

Design Thinking

Validate your solution with users and learn what works or fails.

Slide 33

Design Thinking

Slide 35

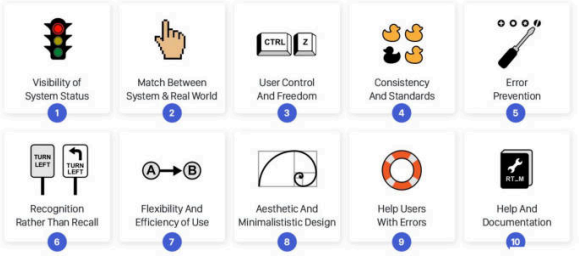

The U.U.D Framework

Every exceptional product/feature/functionality must answer three fundamental questions

Is it useful?	Is it usable?	Is it delightful?
Does it solve a real user problem, address genuine needs, and provide clear functional value?	Can users complete tasks efficiently with intuitive navigation, minimal cognitive load, and consistent patterns?	Does it create positive emotional connections, surprise users meaningfully, and build brand loyalty?
