AI PRODUCT MANAGEMENT 2 · DETAILED COURSE

AI Product Strategy and Monetisation

Finding AI opportunities, deciding how to build them, and making them commercially sound.

Chapter 20 of 26 · 20 topics · Edition 2026 · skillnavora.in

CHAPTER 20

AI Product Strategy and Monetisation

Finding AI opportunities, deciding how to build them, and making them commercially sound.

Identifying AI Product Opportunities

Look for frequent, costly tasks involving language, patterns or judgement where partial automation helps.

Look for frequent, costly tasks involving language, patterns or judgement where partial automation helps. The best opportunities also have data available and a clear person who gains.

AI Opportunity Assessment

Scoring a use case on value, feasibility, data readiness, risk and cost before committing.

Score a use case on value, feasibility, data readiness, risk and cost before committing. Decide quickly which opportunities need a prototype and which should be dropped.

AI Product-Market Fit

Evidence that users rely on the AI feature for real outcomes, seen in repeat use and willingness to pay.

Evidence that users rely on the AI feature for real outcomes: repeat use, measurable time saved and willingness to pay. Novelty use fades; reliance does not.

Build vs Buy vs Partner

Decide by differentiation, speed, cost, control and data sensitivity.

Decide by differentiation, speed, cost, control and data sensitivity. Build what makes you different, buy commodity capability and partner when you need speed or expertise.

AI Business Models

Seat-based, usage-based, outcome-based, add-on and platform models, each with different margins and risks.

Seat-based, usage-based, outcome-based, add-on and platform models each have different margins and risks. Usage-based models protect margin when costs scale, but they make revenue less predictable.

AI Product Pricing

Price to value delivered while covering variable inference cost, with tiers and limits.

Price to the value delivered while covering variable inference cost. Tiers and usage limits keep heavy users from eroding margin.

Usage-Based Pricing

Charging by tokens, requests, tasks or outcomes, matching revenue to cost.

Charge by tokens, requests, tasks or outcomes, so revenue follows cost. Customers need a clear way to estimate and control their spend.

Subscription Monetisation

Fixed plans with usage allowances, simple to buy but sensitive to heavy users.

Fixed plans with usage allowances are simple to buy but sensitive to heavy users. Monitor cost per plan so a small group of heavy users does not make a plan unprofitable.

Enterprise AI Monetisation

Contracts, platform fees, integrations and services for large customers, often with security reviews.

Large customers pay through contracts, platform fees, integrations and services, often after security reviews. Price in the cost of those reviews and of custom integration.

AI Unit Economics

Margin per user or task after inference, data, support and infrastructure costs.

Margin per user or per task after inference, data, support and infrastructure costs. Know the margin before scaling, not after.

Inference Cost Management

Reducing cost via smaller models, caching, shorter prompts, batching and routing.

Reduce cost through smaller models for simple tasks, caching, shorter prompts, batching and routing. Routing sends easy requests to cheap models and hard ones to strong models.

Token Economics

Understanding price per million tokens and how prompt design and volume change cost.

Understand the price per million tokens and how prompt design and volume change cost. Long system prompts sent with every request can dominate cost.

AI ROI Calculation

Benefit (time saved, revenue gained, cost avoided) minus total cost, over the cost.

ROI is the benefit (time saved, revenue gained or cost avoided) minus total cost, divided by total cost. Measure the benefit against a baseline, not against a guess.

Total Cost of Ownership

All costs over time: models, infrastructure, data, people, governance and maintenance.

Total cost includes models, infrastructure, data, people, governance and maintenance over the life of the product. Many AI projects underestimate maintenance, especially evaluation.

AI Product Differentiation

Advantages from proprietary data, workflow integration, evaluation quality, distribution and trust.

Advantages come from proprietary data, workflow integration, evaluation quality, distribution and trust. A better model alone is a weak advantage because competitors can access the same models.

AI Competitive Positioning

Defining where you win against general-purpose assistants and rival tools.

Define where you win against general-purpose assistants and rival tools. Be specific about the job, the user and the workflow you serve better.

AI Product GTM

Positioning, pricing, proof points, pilots and enablement for launching AI products.

Positioning, pricing, proof points, pilots and enablement for launching AI products. Enterprise buyers often want a pilot with measurable results before a contract.

Enterprise AI Adoption

Moving from pilot to production through change management, integration and governance.

Moving from pilot to production through change management, integration and governance. Most AI pilots fail at adoption, not at the model.

AI Customer Retention

Keeping customers through reliability, improving quality, integration and shown outcomes.

Keep customers through reliability, improving quality, integration and shown outcomes. Regular reports on results help customers see the value.

AI Product Scaling

Growing usage while controlling cost, quality, latency and risk.

Grow usage while controlling cost, quality, latency and risk. Scale only after unit economics and quality are stable.

Summary of terms

Term	Meaning
Identifying AI Product Opportunities	Look for frequent, costly tasks involving language, patterns or judgement where partial automation helps.
AI Opportunity Assessment	Scoring a use case on value, feasibility, data readiness, risk and cost before committing.
AI Product-Market Fit	Evidence that users rely on the AI feature for real outcomes, seen in repeat use and willingness to pay.
Build vs Buy vs Partner	Decide by differentiation, speed, cost, control and data sensitivity.

AI Business Models	Seat-based, usage-based, outcome-based, add-on and platform models, each with different margins and risks.
AI Product Pricing	Price to value delivered while covering variable inference cost, with tiers and limits.
Usage-Based Pricing	Charging by tokens, requests, tasks or outcomes, matching revenue to cost.
Subscription Monetisation	Fixed plans with usage allowances, simple to buy but sensitive to heavy users.
Enterprise AI Monetisation	Contracts, platform fees, integrations and services for large customers, often with security reviews.
AI Unit Economics	Margin per user or task after inference, data, support and infrastructure costs.
Inference Cost Management	Reducing cost via smaller models, caching, shorter prompts, batching and routing.
Token Economics	Understanding price per million tokens and how prompt design and volume change cost.
AI ROI Calculation	Benefit (time saved, revenue gained, cost avoided) minus total cost, over the cost.
Total Cost of Ownership	All costs over time: models, infrastructure, data, people, governance and maintenance.
AI Product Differentiation	Advantages from proprietary data, workflow integration, evaluation quality, distribution and trust.
AI Competitive Positioning	Defining where you win against general-purpose assistants and rival tools.
AI Product GTM	Positioning, pricing, proof points, pilots and enablement for launching AI products.
Enterprise AI Adoption	Moving from pilot to production through change management, integration and governance.
AI Customer Retention	Keeping customers through reliability, improving quality, integration and shown outcomes.
AI Product Scaling	Growing usage while controlling cost, quality, latency and risk.

Practice exercise: Estimate unit economics for an AI feature: tokens per task, cost per task, price, margin and the usage level where it stops being profitable.

Self-check

1. Explain Identifying AI Product Opportunities in two sentences to a non-technical stakeholder, then say what you would measure for it.
2. Explain Inference Cost Management in two sentences to a non-technical stakeholder, then say what you would measure for it.
3. Explain AI Product Scaling in two sentences to a non-technical stakeholder, then say what you would measure for it.

PM frameworks cheat sheet

Framework	Use it to	How it works
RICE	Prioritise a backlog	Reach × Impact × Confidence ÷ Effort. Score each idea, then sanity-check the ranking.
Kano	Decide which features delight	Classify features as Must-be, Performance, Attractive, Indifferent or Reverse using a short survey.
MoSCoW	Scope a release	Must have, Should have, Could have, Won't have (this time).
Jobs-to-be-done	Understand motivation	When [situation], I want to [motivation], so I can [outcome].
AARRR (Pirate metrics)	Map the growth funnel	Acquisition, Activation, Retention, Referral, Revenue.
HEART	Measure user experience	Happiness, Engagement, Adoption, Retention, Task success, each with goals, signals and metrics.
North Star metric	Align the team	One metric that captures the value users get, supported by input metrics the team can move.
Five whys	Find the root cause	Ask 'why?' repeatedly until you reach a cause you can act on.
CIRCLES	Answer product design questions	Comprehend, Identify users, Report needs, Cut through prioritisation, List solutions, Evaluate trade-offs, Summarise.

PRD template

PRD: [Feature name] Owner: [Name] · Status: Draft · Last updated: [Date] 1. Problem Who has the problem, what it is, and the evidence (data, interviews, tickets). 2. Goal and success metrics Primary metric (with baseline and target), secondary metrics, guardrails. 3. Users and use cases Target segment, top 3 user stories: "As a [user], I want [action] so that [benefit]." 4. Solution What we'll build (link designs), what's out of scope, open questions. 5. AI behaviour (if applicable) Inputs, model, prompt/approach, what it must never do, human review, evaluation set and pass criteria, cost per request. 6. Launch plan Experiment design, rollout stages, support and comms, rollback criteria. 7. Risks and dependencies Technical, legal/privacy, operational; owners and mitigations.
