MODULE 11 ADDENDUM

Vibe Coding for Non-Coders: addendum

The coverage check of Module 11, with the missing topics and a safety checklist.

Read after Module 11.

Vibe Coding for Non-Coders: coverage check and addendum

This addendum checks the Vibe Coding module (Module 11) against what a non-coder needs, and adds what is missing. The original chapter and class slides are unchanged.

What the module already covers

- What vibe coding is and how to describe an app in plain English.
- Lovable and other app builders, with step-by-step prompts.
- Previewing and testing a generated app; debugging error messages.
- Connecting a database (Supabase), login and user accounts, saving code to GitHub.
- Deploying and publishing; API keys and secrets basics; privacy basics.
- When a non-coder needs a developer; beginner exercises and project examples.

What was missing and is added here

Custom domain
Connecting your own domain name (for example yourname.com) to the app, and what DNS records you change. Not covered in the chapter.
Where to learn it: Lovable's documentation on custom domains, and your domain registrar's DNS guide.

Credits and tokens
The chapter mentions cost only briefly. Non-coders need to know which actions use credits, how long chats add cost, and how to plan a monthly budget. See the Tokens and Pricing Handbook.
Where to learn it: https://platform.claude.com/docs/en/about-claude/pricing

Claude Code
Only mentioned in passing. The full tutorial is Module 15 (Claude Code: basic to advanced). Read it after this module.
Where to learn it: Module 15 handbook in the PM library.

Glossary of terms
No glossary. Use the PM Glossary Handbook, which defines vibe coding, prompt, token, API, database, deployment and more.
Where to learn it: PM Glossary Handbook in the PM library.

Non-coder safety checklist
Before you publish: no secret keys in the front end, real login, row-level security on user data, a backup, and a test with a second device.
Where to learn it: Covered in part in the chapter; this addendum adds a checklist.

Non-coder safety checklist before you publish

1. No secret keys (API keys, passwords) in any code that runs in the browser.
2. Real login, and a rule that each user can see only their own data.
3. Test the app on a phone and a laptop, and with a second account.
4. A backup of your project and a copy of your data.
5. Know who to call when something breaks in production, and what you will do then.

Exercise

Build a one-page booking form in an app builder, then write three sentences that explain its cost in tokens and credits, its data and its privacy risks.
