PART 1 · MODULE A

Data fundamentals

The basics every data role depends on.

A1. Data types

Structured data sits in tables with fixed columns (sales records). Unstructured data is free text, images or audio. Semi-structured data (JSON) has tags but flexible shape.

A2. Cleaning, validation and transformation

Cleaning fixes missing, duplicate and wrong values. Validation checks rules (an amount is a number above zero). Transformation reshapes data for analysis (grouping, joining, calculating new columns).

A3. From data to business meaning

Every chart or table should answer a business question: what happened, why, and what to do. Write the question first.
